

### Representation of knowledge

PSY 200  
 Greg Francis  
 Lecture 23

*What is a shoe?*

1

### Concepts

- What is the information in Long Term Memory?
  - May be several different types
- We have knowledge about the world
  - Due to personal experience
  - Or due to language
- Such information must be in some kind of format, which we call concepts
- But what are the concepts?
  - what is the concept of “dog,” “walking,” or “free-market capitalism”?

2

### Concepts

- We will look at three topics in concepts
  - Definitions (don’ t really work)
  - Prototypes (closer to how humans think)
  - Exemplars (more likely than prototypes)
- And then combinations of concepts
  - propositions

3

### Definitions

- Plato (and Socrates) spent a lot of effort trying to define terms like *virtue* and *knowledge*
  - they were largely unsuccessful
- the 20th century philosopher Wittgenstein wondered if definitions of even simple concepts were possible

4

### Definitions

- Consider the concept *shoe*, you might define it as Webster’ s Dictionary does
  - A covering for the human foot, usually made of leather, having a thick and somewhat stiff sole and a lighter top.
  - Anything resembling a shoe in form, position, or use.
- Lots of shoes fit this definition

5

### Definitions

- Consider the concept *shoe*, you might define it as Webster’ s Dictionary does
  - A covering for the human foot, usually made of leather, having a thick and somewhat stiff sole and a lighter top.
  - Anything resembling a shoe in form, position, or use.
- But now consider some situations and decide if they are really shoes
  - A shoe that is intended for display only

6

### Definitions

- Consider the concept *shoe*, you might define it as Webster’s Dictionary does
  - ♦ A covering for the human foot, usually made of leather, having a thick and somewhat stiff sole and a lighter top.
  - ♦ Anything resembling a shoe in form, position, or use.
- But now consider some situations and decide if they are really shoes
  - ♦ a shoe filled with cement, which cannot be worn
  - ♦ a covering worn on the hands of a person without legs who walks on his hands
  - ♦ And this? →

7

### Definitions

- The difficulty is the same one that Plato and Socrates had trying to define *virtue*
  - ♦ for any definition you come up with, I can find examples that do not seem to fit the definition
- But we all know what a *shoe* is
  - ♦ so our knowledge of this concept must not be based on some precise definition
- Note, scientists can (sometimes) create precise definitions (e.g., a dog is defined by a DNA pattern or by mating abilities)
  - ♦ but the definition is somewhat arbitrary

Purdue University

8

### Prototypes

- Perhaps what defines a concept is similarity among its members
  - ♦ there may be no *absolutely necessary* characteristics
  - ♦ there may be no *absolutely sufficient* characteristics
- Prototype theory supposes that similarity is judged relative to a prototype example of the concept
  - ♦ e.g., an ideal, average, or most frequent version of the concept

Purdue University

9

### Prototypes

- In prototype theory it is possible for an object to be “more” or “less” a certain concept
- Consider the concept “coffee cup”

Purdue University

10

### Prototypes

- In prototype theory it is possible for an object to be “more” or “less” a certain concept
- Consider the concept “coffee cup”
  - ♦ and variations (some are “cup-ier” than others)

Purdue University

11

### Prototypes

- In prototype theory it is possible for an object to be “more” or “less” a certain concept
- Consider the concept “coffee cup”
  - ♦ and variations (some are “cup-ier” than others)

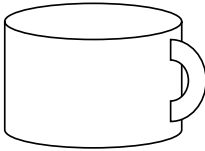

Purdue University

12

### Prototypes

- In prototype theory it is possible for an object to be “more” or “less” a certain concept
- Consider the concept “coffee cup”
  - and variations (some are “cup-ier” than others)

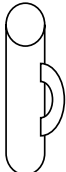

Purdue University 

13

### Prototypes

- In prototype theory it is possible for an object to be “more” or “less” a certain concept
- Consider the concept “coffee cup”
  - and variations (some are “cup-ier” than others)

Purdue University 

14

### Prototypes

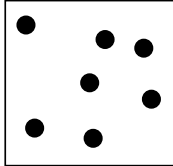

- Lots of experiments suggest the role of prototypes
  - Posner & Keele (1968): learning category names for random dot patterns
  - Discriminate two sets of random dot patterns
  - Each pattern is a variation of one of two prototype patterns

Purdue University 

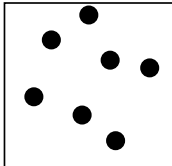

15

### Prototypes

- Prototypes

**A**

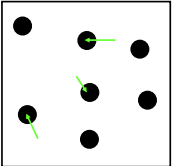

**B**

Purdue University 

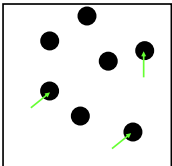

16

### Prototypes

- variations are made by moving some of the dots

**variant of A**

**variant of B**

- subjects learn to classify many different variants
  - they never see the prototypes themselves

Purdue University 

17

### Prototypes

- The key test is done after subjects learn to classify the variants
  - reaction time for judgment is recorded for stimuli they have never seen before
    - new variants
    - the prototypes
  - reaction time is faster for the prototypes
  - which suggests that the mental representation of the categories (concepts) are built to favor the prototype of the category
- Look at CogLab data

Purdue University 

18

### Prototypes

- Results are based on data from 145 participants (39,285 for global).
 

Pattern type	Reaction time (ms)	Global RT (ms)
Prototypes	798	969
Variants	843	1000
- Unanswered by this (and many other) experiments is what a prototype is:
  - a "thing" that resides in memory and contains information about the category features?
  - the result of processing information?
- A bit of thought suggests it is the result of processing information

Purdue University

19

### Prototypes

- Consider the types of concepts you can have
  - and how specific they can be
- things: bird, dog, chair, shoe,...
- actions: walking, running, sleeping,...
- goal-derived: "things to eat on a diet", "things to carry out of a house in case of a fire" ,...
- ad hoc*: "things that could fall on your head", "things you might see while in Paris", "gifts to give one's former high school friend who has just had her second baby", ,...
- When studied, these concepts all seem to have prototype characteristics

Purdue University

20

### Prototypes

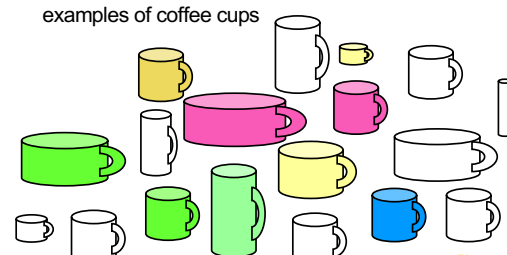

- We can generate new concepts from old concepts
  - it's inconceivable that every possible prototype exists ready to be used
  - some must just be built as they are needed
  - perhaps even the prototypes for simple concepts like "bird" or "shoe" are also just built when they are needed
- A theory that can account for this processing approach is *exemplar theory*

Purdue University

21

### Exemplars

- A concept consists of lots of *examples* of the concept
  - e.g., a "coffee cup" concept might contain lots of examples of coffee cups

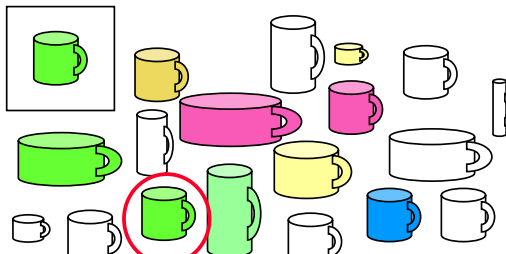

Purdue University

22

### Exemplars

- Comparing an object to see if it is a coffee cup involves comparing it to each example in memory and seeing if it matches anything well enough

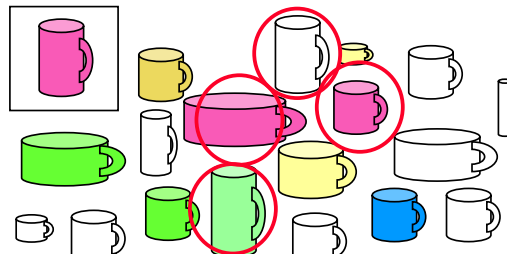

Purdue University

23

### Exemplars

- Even if it is a new object, it may match several exemplars well enough to generate an overall response to indicate it is a coffee cup

Purdue University

24

### Exemplars

- Some coffee cups seem prototypical because they match lots of exemplars
  - that's what defines a prototype

25

### Exemplars

- Unlike prototype theory, exemplar theory also contains information about the variability of examples within a concept
- Thus, we know that pizzas have an average size of 16 inches but can come in lots of different sizes
- And we know that foot-long rulers have an average size of 12 inches, but essentially no variability in size

26

### Complex associations

- How do we represent a concept that involves combinations of concepts?
  - e.g., "Dogs chase cats."
  - e.g., "Last Spring, Jacob fed the pigeons in Trafalgar Square."
- Need to identify the role of each concept

27

### Propositions

- Higher order ideas
  - things doing something
- Statement that is either true or false
  - things cannot be judged true or false
  - e.g., Book, Albert, Threw, Professor, Test, Gave
  - consists of an ordered list of concepts
    - e.g., (relation:X, Agent:Y, Object:Z)

Albert threw the book.

(relation:Threw, Agent:Albert, Object:Book)

(Threw, Albert, Book)

28

### Proposition

- Network Representation
  - The proposition connects the appropriate concept nodes

29

### Proposition

- Network Representation
  - The proposition connects the appropriate concept nodes

41

42

43

### Proposition

- Test Phase : Priming Task
  - compare RTs for second in a pair of words
  - within a common proposition (bandit -- passport)
  - between propositions (passport -- signature)
  - not related in sentence (horizon -- signature)
  - interested in RT to *second* word in each pair
- Ratcliff & McKoon (1978)
  - results
    - » within same proposition words: 561 msec
    - » between proposition words: 581 msec
    - » unrelated: 671
  - evidence of priming by propositional activation
- We *think* in propositions! Purdue University

44

### Conclusions

- Concepts
  - definitions
  - prototypes
  - exemplars
- Propositions
  - Evidence we think in terms of propositions

Purdue University

45

### Next time

- Other types of knowledge
- Mental images
  - mental rotation
  - mental scaling
  - limitations of
- CogLab on Mental rotation due!
- Is a picture in your head like a picture in the world?*

Purdue University
